

Chapter4:

Data structures, Missing data, NA, and CSV file in R Programming

Asst. Prof. Dr. Supakit Nootyaskool
supakit@it.kmitl.ac.th

Learning Objective

- To obtain five data structure in R
- To examine missing data, inf and n/a data.
- To understand access to CSV file and object file.

Topic

- Five data structure in R
- Missing Data, Infinity value, and Not a number
- Reading CSV file
- Writing CSV file
- Get data by condition
- Save or load object

4.1 Five types of data structure

Data structures are used to store data in the organization and doing data manipulation. R has five data structures consist:

1. Vector `ve = c(12.1, 12.2, 14)`
2. List `li = list(ve, c(1,2,3,4), "Jan", "Hello")`
3. Matrix `ma = matrix(c(1:9), nrow=3, ncol=3, byrow=true)`
4. Data frame
`dfId = c(1:4)`
`dfName = c("Justin", "Donald", "Mark", "Adele")`
`dfNum = c(225, 3100, 73, 135)`
`dfType = c(2,1,3,2)`
`df = data.frame(dfId, dfName, dfNum, dfType)`
5. Factor

4.1.1 Vector

Vector is homogenous data that contains elements of the same data types by numeric, integer, character, complex or logical

```
ve = c(14, 12.1, 12.2, 11.159)
```

```
ve[3] = ve[1] + ve[2]
```

```
length(ve)
```

```
sort(ve, decreasing=TRUE)
```

```
R Console
> ve = c(14, 12.1, 12.2, 11.159)
> ve[3] = ve[1] + ve[2]
> length(ve)
[1] 4
> sort(ve, decreasing=TRUE)
[1] 26.100 14.000 12.100 11.159
> |
```

```
veStr = c("aa", "cc", "bb")
```

```
sort(veStr)
```

```
R Console
> veStr = c("aa", "cc", "bb")
> sort(veStr)
[1] "aa" "bb" "cc"
```

4.1.1 Vector: Indexing, selection

x[1] #first element of x

x[1:5] #Get element 1 to 5

x[c(2,5,6)] #Get elements 3,5,6

z=c(3,5,6) ; x[z]

x[x>=5] #Find elements of $x \geq 5$

k=x>=5 ; x[k]

a=which(x>=5);x[a]

```
R Console
> x = c(11,22,33,44,55,66)
> x[1:3]
[1] 11 22 33
> x[c(2,5)]
[1] 22 55
> i = c(2,5,6)
> x[i]
[1] 22 55 66
> k = x>5
> k
[1] TRUE TRUE TRUE TRUE TRUE TRUE
> k = x>30
> k
[1] FALSE FALSE TRUE TRUE TRUE TRUE
> x[k]
[1] 33 44 55 66
> a = which(x>30);x[a]
[1] 33 44 55 66
> |
```

4.1.2 List

List is non-homogenous data that can contain different data types.

```
veVal = c(14, 12.1, 12.2, 11.159)
```

```
veStr = c("aa", "cc", "bb")
```

```
liData = list(veVal, veStr, "3.14", "hello")
```

```
print(liData)
```

```
R Console
> veVal = c(14, 12.1, 12.2, 11.159)
> veStr = c("aa", "cc", "bb")
> liData = list(veVal, veStr, "3.14", "hello")
> print(liData)
[[1]]
[1] 14.000 12.100 12.200 11.159

[[2]]
[1] "aa" "cc" "bb"

[[3]]
[1] "3.14"

[[4]]
[1] "hello"
```

4.1.3 Matrix

Matrix is 2-dimensional data in form homogenous data.

```
maA = matrix(c(1:9), nrow=3, ncol=3, byrow=TRUE)
```

```
print(maA)
```

```
maB = matrix(c(1:9), nrow=3, ncol=3, byrow=FALSE)
```

```
print(maB)
```

```
> maA = matrix(c(1:9), nrow=3, ncol=3, byrow=TRUE)
> print(maA)
      [,1] [,2] [,3]
[1,]    1    2    3
[2,]    4    5    6
[3,]    7    8    9
>
> maB = matrix(c(1:9), nrow=3, ncol=3, byrow=FALSE)
> print(maB)
      [,1] [,2] [,3]
[1,]    1    4    7
[2,]    2    5    8
[3,]    3    6    9
```

4.1.3 Matrix: R/C

m[r,] #Get by row

m[,c] #Get by column

m1%*%m2 # Production matrix

det(m) #Determinent matrix

t(m) #Transpose matrix

```
R Console
> m = matrix(c(-2,2,-3,-1,1,3,2,0,-1),3,3)
> n = matrix(2,3,3)
> m*n
      [,1] [,2] [,3]
[1,]   -4   -2    4
[2,]    4    2    0
[3,]   -6    6   -2
> m %*% n
      [,1] [,2] [,3]
[1,]   -2   -2   -2
[2,]    6    6    6
[3,]   -2   -2   -2
> m
      [,1] [,2] [,3]
[1,]   -2   -1    2
[2,]    2    1    0
[3,]   -3    3   -1
> n
      [,1] [,2] [,3]
[1,]    2    2    2
[2,]    2    2    2
[3,]    2    2    2
> |
```

```
R Console
> det(m)
[1] 18
> t(m)
      [,1] [,2] [,3]
[1,]   -2    2   -3
[2,]   -1    1    3
[3,]    2    0   -1
> |
```

4.1.3 Matrix: Combine, remove, row, column of matrices

x = c(1:10); y = c(10:1) #Generating data

m = cbind(x,y,x,y) #Combine data

a = m[, -2] #Remove the second column

b = m[-2,] #Remove the second row

a = m[1:2,] #Select column 1 to 2

```
R Console
> a = m[, -2]
> a
      x  x  y
[1,]  1  1 10
[2,]  2  2  9
[3,]  3  3  8
[4,]  4  4  7
[5,]  5  5  6
[6,]  6  6  5
[7,]  7  7  4
[8,]  8  8  3
[9,]  9  9  2
[10,] 10 10  1
> |
```

```
R Console
> c = m[1:2, ]
> c
      x  y  x  y
[1,]  1 10  1 10
[2,]  2  9  2  9
> |
```

```
R Console
> x = c(1:10); y = c(10:1)
> x
[1]  1  2  3  4  5  6  7  8  9 10
> y
[1] 10  9  8  7  6  5  4  3  2  1
> m = cbind(x,y,x,y)
> m
      x  y  x  y
[1,]  1 10  1 10
[2,]  2  9  2  9
[3,]  3  8  3  8
[4,]  4  7  4  7
[5,]  5  6  5  6
[6,]  6  5  6  5
[7,]  7  4  7  4
[8,]  8  3  8  3
[9,]  9  2  9  2
[10,] 10  1 10  1
> |
```

List vs Matrix

- Lists are not restricted to a single mode and can encompass any mixture of data types.
- Matrixes are not a separate type of object but simply an atomic vector with dimensions; the number of rows and columns.

R Console

```
> m = matrix(c(11,22,33,44),2,2)
```

```
> m
```

```
      [,1] [,2]  
[1,]   11   33  
[2,]   22   44
```

```
> l = list("pi",3.14,"eV",1.602e-12)
```

```
> l
```

```
[[1]]  
[1] "pi"
```

```
[[2]]  
[1] 3.14
```

```
[[3]]  
[1] "eV"
```

```
[[4]]  
[1] 1.602e-12
```

```
> is.matrix(l)
```

```
[1] FALSE
```

```
> is.list(m)
```

```
[1] FALSE
```

4.1.4 Data frame

Data frame is 2-dimensional data like the matrix, but it is non-homogenous.

```
dfId = c(1:4)
```

```
dfName = c("Justin", "Donald", "Mark", "Adele")
```

```
dfNum = c(225, 3100, 73, 135)
```

```
dfType = c(2,1,3,2)
```

```
df = data.frame(dfId, dfName, dfNum, dfType)
```

```
summary(df)
```

```
> df = data.frame(dfId, dfName, dfNum, dfType)
> 
> df
  dfId dfName dfNum dfType
1     1 Justin   225      2
2     2 Donald 3100      1
3     3   Mark    73      3
4     4  Adele   135      2
> summary(df)
      dfId      dfName      dfNum      dfType 
Min.   :1.00  Length:4  Min.    : 73.0  Min.    :1.00 
1st Qu.:1.75  Class :character 1st Qu.: 119.5 1st Qu.:1.75 
Median :2.50  Mode  :character Median : 180.0 Median :2.00 
Mean    :2.50          Mean    : 883.2 Mean    :2.00 
3rd Qu.:3.25          3rd Qu.: 943.8 3rd Qu.:2.25 
Max.    :4.00          Max.    :3100.0 Max.    :3.00
```

4.1.5 Factor

Factor is data type to analyze and categorize unique values in columns or vector.

```
brand = c(
  "honda",
  "honda",
  "toyota",
  "mini",
  "mini",
  "saab",
  "saab")
```

```
factor(brand)
```

```
> brand = c(
+ "honda",
+ "honda",
+ "toyota",
+ "mini",
+ "mini",
+ "saab",
+ "saab")
> factor(brand)
[1] honda  honda  toyota mini   mini   saab   saab
Levels: honda mini saab toyota
> f = factor(brand)
> f
[1] honda  honda  toyota mini   mini   saab   saab
Levels: honda mini saab toyota
```

4.2 Missing Data, Infinity value, and Not a number

R supports missing data in the vector

```
x = c(0.5, NA, 0.7)  #create a vector with NA
is.na(x)              #show which one NA in the vector
anyNA(x)              #Is the vector has NA?
```

```
y = 1/0              #y has Inf
is.na(y); is.nan(y)
```

```
z = 0/0              #z has NaN
is.na(z); is.nan(z)
```

4.3.1 Reading CSV file

A function is used to import the CSV file to R variable. Download an example CSV from

<http://161.246.38.75/download/babd/chap04/corona.csv>

`c = read.csv("corona.csv")` #get data

`summary(c)` #calculation summary

`head(c)` #show head of the data

```
> c = read.csv("corona.csv")
```

```
> head(c)
```

	date	county	state	fips	cases	deaths
1	2020-01-21	Snohomish	Washington	53061	1	0
2	2020-01-22	Snohomish	Washington	53061	1	0
3	2020-01-23	Snohomish	Washington	53061	1	0
4	2020-01-24	Cook	Illinois	17031	1	0
5	2020-01-24	Snohomish	Washington	53061	1	0
6	2020-01-25	Orange	California	6059	1	0

```
> summary(c)
```

4.3.1 Access in each row/column

`is.list(c)` `#List?`

`c[1,1]` `#Get first row and first column`

`c[, 1]` `#Get first row`

`c[1, ]` `#Get first column`

`head(c)`

`c$state` `#Get all data in "state"`

`c$state[1:1]` `#Get 1 to 10 in "state"`

```
> is.list(c)
[1] TRUE
> c[1,1]
[1] "2020-01-21"
> c[1, ]
      date      county      state  fips cases deaths
1 2020-01-21 Snohomish Washington 53061     1      0
> head(c)
      date      county      state  fips cases deaths
1 2020-01-21 Snohomish Washington 53061     1      0
2 2020-01-22 Snohomish Washington 53061     1      0
3 2020-01-23 Snohomish Washington 53061     1      0
4 2020-01-24      Cook    Illinois 17031     1      0
5 2020-01-24 Snohomish Washington 53061     1      0
6 2020-01-25   Orange California  6059     1      0
> c$state[5:10]
[1] "Washington" "California" "Illinois"    "Washington" "Arizona"
[6] "California"
```

4.3.2 Write CSV file

```
d = data.frame(  
  name = c("Jon", "Bill", "Maria"),  
  age = c(23,41,32))
```

```
print (d)
```

```
write.csv(df,  
  "data.csv",  
  row.names = FALSE)
```

R Console

```
> d = data.frame(  
+ name = c("Jon", "Bill", "Maria"),  
+       age = c(23,41,32))  
>  
> print (d)  
  name age  
1  Jon  23  
2 Bill  41  
3 Maria 32  
>  
> write.csv(df,  
+ "data.csv",  
+ row.names = FALSE)  
>
```

data.csv - Notepad

File Edit Format View Help

```
"dfId","dfName","dfNum","dfType"  
1,"Justin",225,2  
2,"Donald",3100,1  
3,"Mark",73,3  
4,"Adele",135,2
```

4.4 Get data by condition

`head(c)` #Show head

`cW = c[c$state == "Washington",]` #Get data by condition

`write.csv(cW,`
 `"dataWashington.csv",`

`row.names = FALSE)` #Write to CSV

`plot(cW$death)` #Plot

4.5 Save / Load Object

`save(cW, file= "cw.dat")` `#save an object`

`save(list = ls(),file="all.dat")` `#save all object`

`rm(list=ls())` `#clear all memory`

`dir()` `#show list file in the directory`

`load("all.dat")` `#load objects in "all.data"`

```
R Console
> ls()
[1] "a"      "aa"     "area"   "arr"    "b"      "brand"  "c"      "cW"
[9] "d"      "df"     "dfId"   "dfName" "dfNum"  "dfType" "f"      "fc"
[17] "k"      "li"     "liData" "m"      "maA"    "maB"    "n"      "r"
[25] "radius" "rs"     "ve"     "veStr"  "veText" "veVal"  "x"      "y"
[33] "yy"     "z"
> save(list = ls(),file="all.dat")
> rm(list=ls())
> ls()
character(0)
> load("all.dat")
> ls()
[1] "a"      "aa"     "area"   "arr"    "b"      "brand"  "c"      "cW"
